## **Abstract**

A finite family  $F$  is union-closed if and only if for any  $A, B \in F$  implies  $A \cup B \in F$ . The Families defined like this are well-known for the union-closed conjecture.

In this paper, We mainly discuss the structure of Union-closed family based on several new definitions and viewpoints such as minimal element, maximal element, acyclic digraph in part II, III, IV. One of the results in this note is that we proof that an union-closed family is always built up by a fixed recurrence relation and several initial sets given at first (Therom3.1). We prove some results on the union-closed conjecture in part VI based on the structure of the union-closed family.

In part III, we also analyzed the structure of more general partially ordered set based on the method and definition used in part II and III.

## **1. introduction**

### **Definition 1.1**

Let  $F$  be a family of sets which satisfied the following property: For any  $A, B \in F$ , there exists an element  $C = A \cup B \in F$ . Then we call this kind of family is union-closed.

Based on the definition 1.1, Frankl writes down the following conjecture in 1979:

### **Conjecture 1.1**

Frankl's conjecture states that: for any finite union-closed family of sets  $F \neq \{\emptyset\}$  has an element that is contained in at least half of the member-sets.

Although this statement is simple and easy to understand and, it still wide open. About this system we have proofed some special cases and give several relevant estimations on this system. Generally speaking, there are three viewpoints on this conjecture, which are graph, sets, lattice, correspondingly, this conjecture can be translated into several major forms.

And there are also two mainly methods used to solve this method, which are set up a function between the sets which have the element  $a$  which is supposed to be the abundant one and those sets who don't have element  $a$ . If we prove this is an injection, then we prove the Frankl's conjecture. Another powerful way to solve is considering the averaging, although it may not work for all the union-closed family, however, if we consider separated union-closed family, this tool seems to be able to solve all the cases, furthermore to solve this conjecture

In set theory, the formulations can be stated as follows besides the form mentioned in conjecture one:

### **Conjecture 1.2**

For any family of proper subsets of  $U$  closed under intersection, there must exist some element of  $U$  that belongs to at most half of the sets of  $F$ .

As for graph, the formulation is related to bipartite graph. it is stated as follows:

### **Conjecture 1.3**

Let  $G$  be a finite graph with at least one edge. Then there will be two adjacent vertices each belonging to at most half of the maximal stable sets.

It also can be translated into conjecture 4.

### **Conjecture 1.4**

.Let  $G$  be a finite graph with at least one edge. Then there will be two adjacent vertices each belonging to at most half of the maximal stable sets.

Besides graph and sets theory, it can be also relevant to lattice, which has a formulation like this:

### **Conjecture 1.5**

Let  $L$  be a finite lattice with at least two elements. Then there is a join-irreducible element  $a$  with  $|\{a\}| \leq 1/2 |L|$ .

No matter which form it states, one of the reasons on why this conjecture is difficult to solve is about the complex and varied forms of this kind of family. For example, when it comes to discuss the conjecture 5, some special cases have been solved: Reinhold proof that the conjecture 5 holds for

Lower semimodular lattice. Poonen shows that this conjecture is true for geometric, and then upper semimodular. Abe discuss the case for strong upper semimodular lattices. From the results on lattice form for this conjecture , we can find that although several cases are solved ,however , up to now it is only a subclass of lattices and so many cases are left to discuss, of course, we cannot rule out the possibility that this conjecture cannot be solved by just discussing more extra conditions, which means we finally find that all the lattices can be classified into several cases and every case is supposed to solve. The similiar gap between us and the answer to this conjecture also exists in graph and sets theory. Considering this, some researches have tried to estimate average. we just need to prove for every finite union-closed family  $F$ , the following posture is True:

$$\frac{1}{|\cup F|} \cdot \sum_{a \in \cup F} |Fa| \geq \frac{1}{2} |F| \quad (1)$$

In this posture,  $\cup F$  refers to a set combined by all the elements exists in the family  $F$ .  $Fa$  refers to a set whose elements are the sets in  $F$  contain the element  $a$ . When we considering this principle, we don't have to point out which element who exists in over  $\frac{1}{2}$  sets of the Family ,this is an advantage towards discussing some specific cases ,But this

methods also have its limitations ,it is not always true. For example, we consider the following union-closed family:

$$\{\{a_1\},\{a_1,a_2\},\{a_1,a_2,a_3,a_4,a_5,a_6,a_7\}\}$$

The left side of (1) is smaller than right side but it does form a union-closed family, which means the average Value Principle doesn't always work for this system.

So it seems that unless we can find a powerful composite object hidden beside the system which works in all cases to tackle this conjecture or we can translate every complex case of union-closed family into several finite simple cases. It seems that one of the practical ways to research this conjecture is still that we make efforts to clarify every possible structure of union-closed family step by step.

The structure of the paper is as following:

In the second part of this paper, we will discuss the Layered decomposition of union-closed family, we will also see how a union-closed family is structure out on the viewpoints of minimal elements in poset. In the third part of the note, we will come back to the theory on poset, after we discuss some universal property on poset, we will know more clearly about the decomposition mentioned in part II. We discuss the structure of the union-closed family based on

directed acyclic graph in part IV. We also give a few new results on the Union-closed family conjecture based on the structure we find out in part VI.

In order to discuss more convenient. Now we give several extra limitations on the union-closed family  $F$ , owing to the union-closed conjecture is equal to the following cases or some other obvious facts, although all these things mentioned below are well-known, However, for the completeness of the note, we present the proof of these cases below.

### (I)

Firstly, we strengthen that we assume that  $|F|$  is a finite number, although we can build Union-closed family whose  $|F|$  is uncountable like  $\{A | \forall x \in A \rightarrow x \in R\}$ , however, considering our final purpose is to proof there exists an element  $x$ , which belongs to at least half of the union-closed family  $F$ , if  $F$  is uncountable, we can't define the concept half.

### (II)

In this note, we assume that  $F$  is a union-closed family which doesn't have the set  $\emptyset$  on account of the following reason:

Fact1.1

It's obviously that  $F$  who has  $\emptyset$  is union-closed if and only if  $F \setminus \{\emptyset\}$  is union-closed, if we proof for every

$F \setminus \{\emptyset\}$  there exists an element  $a$  which  $|Fa| > \frac{1}{2}|F|$ , then  $F$  satisfies conjecture 1.1

### (III)

We strengthen that  $F$  is a set of non-repetitive elements on account of the following example:

#### **Example 1.1**

$\{\{a_1\} \quad \{a_1\} \quad \{a_1\} \quad \{a_2\} \quad \{a_2\} \quad \{a_2\} \quad \{a_3\} \quad \{a_3\} \quad \{a_3\} \quad \{a_1, a_2\} \quad \{a_1, a_3\}, \{a_2, a_3\}, \{a_1, a_2, a_3\}\}$

$F$  is a family which has repetitive elements, for every pair of  $x, y \in F, x \cup y \in F$ , however, it does not satisfy conjecture 1.1.

### (IV)

We call  $a_1, a_2 \in \cup F (a_1 \neq a_2)$  are identical distributed, if for each  $x \in F$  suggests that  $a_1$  and  $a_2 \in x$  or  $a_1$  and  $a_2 \notin x$ . And we define a union-closed family  $F$  is simplified if and only if for each pair of  $a_1, a_2 (a_1 \neq a_2)$ , they are not identical distributed. In this note, we assume that union-closed family  $F$  is simplified on account of the following reason:

#### **Fact 1.2**

If conjecture 1.1 holds for the family which are simplified, then the conjecture holds for all the union-closed family.

#### **Proof:**

Let  $F_1$  be a union-closed family, if it is simplified, then

it's done.

If there exists at least one set  $A_x = \{y \in \bigcup F_1 \mid x, y \text{ are identical distributed}\}$  which  $|A_x| > 1$ , let  $W = \{A_x \mid x \in \bigcup F_1\}$ , for any  $A_x \in W$ , we delete all the elements except  $x$  in  $A_x$  from  $F_1$  and let the new smaller sets  $A^*$  replace the  $A$  in the old union closed family  $F_1$ , then we get a new family  $F_2$ . Notice that this operation doesn't create set  $A^* = \emptyset$ , and it doesn't create  $A^* = B^*$ , so  $F_2$  is still a union-closed family.

Now we get a new union-closed family  $F_2$ . We select an element  $a$  which exists in at least half of the sets in the family, then dating back to  $F_1$ , notice that in fact this operation between  $F_1$  and  $F_2$  is a bijection. Then we find the element  $a$  in  $F_1$  which exists in at least half of the sets in  $F_1$ .

(V)

We assume that  $|F| \geq 1$  and  $|\bigcup F| = m$ ,  $m$  is a positive integer on account of the following reason on account of the following fact:

### Fact1.3

Let union-closed family  $F$  satisfied (i), (iii), and  $|F| \geq 1$  then  $|\bigcup F| = m$ ,  $m$  is a positive integer.

On account of  $\emptyset$  doesn't exist in  $F$  and  $|F| \geq 1$ , so

$m \geq 1$ .

If  $F$  is a union-closed family  $F$  the universe  $\cup F$  has infinite elements there will always exists a pair of  $x, y \in F$  which are identical distributed. Because  $|F|$  is finite, so the  $|W|$  which  $W$  is mentioned in Fact 2.2 is smaller than  $2^{|F|}$ , there must be a pair of  $x, y$  in  $\cup F$  which are identical distributed. It's conflict with  $F$  is simplified.

### **Remark 1.1**

If we want to prove conjecture 1.1, we can consider proofing the case when  $F$  satisfied (i) (iii) (IV)

## **2 .The Layered structure of Union-closed family**

### **Definition 2.1**

$F$  is a finite union-closed family, Let  $\Omega_1$  be a subfamily of  $F$ , We define that  $\Omega_1$  is the 1-th source of  $F$  if:

$$\Omega_1 = \{A \in F \mid \forall B \in F, B \neq A \Rightarrow B \not\subseteq A\}$$

### **Definition 2.2**

$F$  is a finite union-closed family or just a poset, Let  $\Omega_k$  be a subfamily of  $F$ , we define that  $\Omega_k$  ( $k \geq 2$ ) is the  $k$ -th source of  $F$  if:

$\Omega_k = \{A \in F \setminus \bigcup_{i=1}^{k-1} \Omega_i \mid \forall B \in F \setminus \bigcup_{i=1}^{k-1} \Omega_i, B \neq A \Rightarrow B \not\subseteq A\}$ . We call this operation is the minimal element decomposition of a finite union-closed family or a poset  $F$ .

We can find out some basic facts about  $\Omega_k$  ( $k \geq 1$ ) which are defined in definition 1.1 and definition 1.2:

### Definition 2.3

Similarly, we can define the Maximal element decomposition of a finite union-closed family  $F$  or a poset  $F$ :

We define that  $\Phi_1 = \{A \in F \mid \forall B \in F, B \neq A \Rightarrow A \not\subseteq B\}$

For  $k \geq 2$ :

$$\Phi_k = \{A \in F \setminus \bigcup_{i=1}^{k-1} \Phi_i \mid \forall B \in F \setminus \bigcup_{i=1}^{k-1} \Omega_i, B \neq A \Rightarrow A \not\subseteq B\}.$$

### Definition 2.4

We define several symbols:

(I)

let  $F$  be a finite union-closed family,  $|F| = n$ , we use  $i = 1, 2, 3, \dots, n$  to mark the sets  $A \in F$ , we define  $\bigcup F$  as follow :

$$\bigcup F = \bigcup_{i=1}^n A_i$$

(II)

We call  $(A, B)$ , whose  $A, B$  are sets, is a pair of set, and we define  $|(A, B)| = A \cup B$

(III)

We define  $A \setminus B = A - B = \{x \in A \mid x \text{ doesn't belong to } B\}$ .

(IV)

We call  $W$  is a family of set pair if every  $x$  in  $w$  is a set pair and we define  $|w| = \{|x| \mid x \in w\}$

(V)

We define  $(A, B)(1) = A$ ,  $(A, B)(2) = B$

(VI)

We define  $w(1) = \{a \in \cup x (1) \mid x \in w\}$ ,  $w(2) = \{a \in \cup x (2) \mid x \in w\}$

### **Lemma2.1**

$F$  is a finite union-closed family, then there exists a  $K (K < +\infty)$  such that  $\Omega_K = \{\cup F\}$ .

#### **Proof:**

Let  $A_n = \cup F$ , then for any other  $A_i$  belongs to  $F$ ,  $A_i$  is included in  $A_n$ . Because for  $\forall A_i, A_j$  belong to same  $\Omega_i$ ,  $A_i \not\subset A_j$  and  $A_j \not\subset A_i$ ,  $A_n$  must be alone in  $\Omega_K = \{\cup F\}$ .

### **Lemma 2.2**

$F$  is a finite union-closed family, then  $F = \cup_{i=1}^K \Omega_i$ , and for  $1 \leq i < j \leq K$ ,  $\Omega_i \cap \Omega_j = \emptyset$ .

#### **Proof:**

According to the definition of  $\Omega_i$ , for  $1 \leq i < j \leq K$ ,  $\Omega_i \cap \Omega_j = \emptyset$ .

On account of  $F$  is a finite family and every operation to create the next  $\Omega_i$  at least use one  $A_j \in F$ . So  $F = \bigcup_{i=1}^K \Omega_i$ , and for  $1 \leq i < j \leq K$ ,  $\Omega_i \cap \Omega_j = \emptyset$ .

### Lemma 2.3

$F$  is a finite union-closed family,

$F = \bigcup_{i=1}^K \Omega_i$ ,  $|\Omega_i| = l_i$  ( $l_i \in \mathbb{N}^*$ ,  $l_i \geq 1$ ), then for  $1 \leq m < n \leq l_i$ ,  $A_m, A_n \in \Omega_i$ :

$$A_m \not\subseteq A_n, \text{ and } A_n \not\subseteq A_m$$

**Proof:**

Because  $\Omega_i$  can be seen as the minimal elements in set  $F \setminus \bigcup_{i=1}^{k-1} \Omega_i$ . So  $A_m$  and  $A_n$  can't be compared.

### Definition 2.4

$W$  is a family of sets and let  $W = \{A_1, A_2, \dots, A_m\}$ , We define  $L(W) = \{A_i \cup A_j \mid 1 \leq i < j \leq m\}$ .

### Definition 2.5

$W$  is a family of sets and let  $W = \{A_1, A_2, \dots, A_m\}$ ,

We define  $\Omega(w) = \{A \in W \mid \forall B \in w, B \neq A \Rightarrow B \not\subseteq A\}$

**Definition 2.6**

$\mathbf{F}$  is a finite union-closed family,  $\mathbf{F} = \bigcup_{i=1}^n \Omega_i$ ,  $|\Omega_i| = l_i (l_i \in \mathbb{N}^*)$ , then we call  $A \in \Omega_i$  ( $2 \leq i \leq n$ ) is a addition-new-element set of  $\Omega_i$  if:

- (i)  $A \notin L(\Omega_{i-1})$
- (ii)  $\exists B \in \Omega_{i-1}$  such that  $B \subseteq A$

**Definition 2.7**

$\mathbf{F}$  is a finite union-closed family,  $\mathbf{F} = \bigcup_{i=1}^n \Omega_i$ ,  $A \in \Omega_i$  ( $2 \leq i \leq n$ ) is a addition-new-element set of  $\Omega_i$ . then let  $A = A \setminus B \cup B (B \in \Omega_{i-1})$ .

- (i) we call  $A$  is a real addition-new-element set of  $\Omega_i$  if there exists a  $x \in A \setminus B$  and  $x \notin \bigcup_{j=1}^{i-1} \Omega_j$ ,
- (ii) otherwise we call  $A$  is a fake real addition-new-element set of  $\Omega_i$

**Definition 2.8**

$\mathbf{F}$  is a finite union-closed family,  $\mathbf{F} = \bigcup_{i=1}^n \Omega_i$ , for  $1 \leq i \leq n-1$ , Let:

$Q(\Omega_i) = \{(\Delta C, B) | \Delta C = A/B, A \text{ is a real addition-new-element set of } \Omega_i \text{ and } A = A \setminus B \cup B (B \in \Omega_{i+1})\}$

**Definition 2.9**

**F** is a finite union-closed family,  $F = \bigcup_{i=1}^n \Omega_i$ ,  $|\Omega_i| = l_i (l_i \in \mathbb{N}^*)$ , then we call  $A \in \Omega_i$  ( $2 \leq i \leq n$ ) is an old-generated set of  $\Omega_i$ , if:

$$A \in \Omega(L(\Omega_i - 1))$$

### Definition 2.10

**F** is finite union-closed family,  $F = \bigcup_{i=1}^n \Omega_i$ . we define  $E_i = \{A \in \Omega_i | A \text{ is a addition-new-element set of } \Omega_i\}$  we also define  $O_i = \{A \in \Omega_i | A \text{ is an old-generated set of } \Omega_i\}$   
 $N_i = \{A \in \Omega(L(\Omega_i - 1)) | \exists B \in E_i, \text{ such that } B \text{ belongs to } A\}$

### Definition 2.11

**F** is finite union-closed family,  $F = \bigcup_{i=1}^n \Omega_i$ . we define  $E_i = \{A \in \Omega_i | A \text{ is a addition-new-element set of } \Omega_i\}$  we also define  $O_i = \{A \in \Omega_i | A \text{ is an old-generated set of } \Omega_i\}$   
 $N_i = \{A \in \Omega(L(\Omega_i - 1)) | \exists B \in E_i, \text{ such that } B \text{ belongs to } A\}$

### Lemma 2.3

**F** is a finite union-closed family,  $F = \bigcup_{i=1}^n \Omega_i$ ,  $|\Omega_i| = l_i (l_i \in \mathbb{N}^*)$ , then

$$(i) \Omega(L(\Omega_1)) \setminus N_2 \subseteq \Omega_2$$

$$(ii) \Omega(L(\Omega_k)) \setminus N_{k+1} \subseteq \Omega_{k+1} \quad (2 \leq k \leq n-1)$$

**Proof:**

When  $k=1$

Let  $B = A_i \cup A_j, (A_i, A_j \in \Omega_1) B \in \Omega \setminus (L(\Omega_1)) \setminus N_2$ , we need to proof  $B \in \Omega_2$ .

If except  $A_1, A_2, \dots, A_k \in \Omega_1$ , There exists an  $A$  which belongs to  $F/\Omega_1 \cup B$ , such that  $A$  belongs to  $B$ . Let  $A$  belongs to  $\Omega_k (k > 1)$

### Case 1:

There exists only one  $A_i \in \Omega_1$ , which belongs to  $A$ . Then in  $\Omega_2$ , there exists a new additional element in  $\Omega_2$  such that belongs to  $B$ .

### Case 2:

There exists over one elements in  $\Omega_1$  which belong to  $A$ , let it be  $A_1, A_2$ , then  $A_1 \cup A_2$  belongs to  $A$ ,  $A$  belongs to  $B (A \neq B)$ , so  $A_1 \cup A_2$  belongs to  $B$ . It's conflicted with  $B$  doesn't belong to  $N_2$

Now we proof that case one and case two, there exists one but only one case stand, which means for this  $A$ . There exists at least one set  $C$  in  $\Omega_1$  which belongs to the set  $A$ . We assume that  $A$  belongs to  $\Omega_k$ . We see that there exists at least one element in  $\Omega_k - 1$  which belongs to  $A$ , the rest may be Deduced by analogy, so we can find an  $C$  which belongs to  $A$  in  $\Omega_1$ .

### Lemma 3.4

F is a finite union-closed family,  $F = \bigcup_{i=1}^n \Omega_i$ . Then For  $2 \leq i \leq n$  :在此处键入公式。

$\forall A \in \Omega_i$  the following two statements:

(I) A is a addition – new – element set of  $\Omega_i$

(II) A is an old – generated set of  $\Omega_i$ .

One and only one statement about this  $A \in \Omega_i$  is True.

**Proof:**

Let B belong to  $\Omega_i$ , according to the definition of  $\Omega_i$ . There must exists an element A which belongs to  $\Omega_{i-1}$  and A belongs to B:

**Case 1**

If there exists only one A. Then B is a new-additional-element .

**Case 2**

If there exists over two elements  $A_1, A_2 \dots A_s$ , such that  $A_i (i > 0, i < s)$  belongs to B. Then for  $0 < i < j < s+1$ ,  $A_i \cup A_j$  belongs to B. if B doesn't belong to  $A_i \cup A_j$  Then except  $\bigcup_{j=1}^{i-1} \Omega_j$ , there exists a set  $C = A_i \cup A_j$  belongs to B (on account of  $A_i, A_j$  are not comparable, so  $A_i \cup A_j$  doesn't belong to  $\Omega_{i-1}$ .) it's conflicted with B belongs to  $\Omega_i$ .

**Definition 3.10**

**F** is finite union-closed family,  $\mathbf{F} = \bigcup_{i=1}^n \Omega_i$ .

- (I) we define  $E_i = \{A \in \Omega_i \mid A \text{ is a addition-new-element set of } \Omega_i\}$
- (II) we also define  $O_i = \{A \in \Omega_i \mid A \text{ is an old –generated set of } \Omega_i\}$
- (III)  $N_i = \{A \in \Omega(L(\Omega_i - 1)) \mid \exists B \in E_i, \text{ such that } B \text{ belongs to } A\}$

### **Theorem 3.1**

**F** is a finite union-closed family,  $\mathbf{F} = \bigcup_{i=1}^n \Omega_i$ . For  $2 \leq i \leq n$  :, then:

$$\Omega_i \setminus E_i = \Omega(L(\Omega_i - 1)) \setminus N_i$$

### **Proof:**

According to Theorem 3.1,  $\Omega(L(\Omega_i - 1)) \setminus N_i$  belongs to  $\Omega_i$  .

And  $E_i$  belongs to  $\Omega_i$ , so  $\Omega(L(\Omega_i - 1)) \setminus N_i \cup E_i$  belongs to  $\Omega_i$ .

On the other hand.  $\forall A$  belongs to  $\Omega_i$ , According to Theorem 1.2,  $A$  belongs to  $E_i$  or  $A$  belongs to  $\Omega(L(\Omega_i - 1)) \setminus N_i$ . So  $\Omega_i = \Omega(L(\Omega_i - 1)) \setminus N_i \cup E_i$ . Because  $E_i \cap \Omega(L(\Omega_i - 1)) \setminus N_i = \emptyset$  and the  $E_i$  belongs to  $\Omega_i$ , so we get that:  $\Omega_i \setminus E_i = \Omega(L(\Omega_i - 1)) \setminus N_i$ .

### **Remark 3.1**

According to theorem 1.1~1.3, we know that every finite union closed family of set  $F$  can be decided by  $\Omega_1$  and  $Q(\Omega_i)$  ( $2 \leq i \leq n$ ),

On the other hand, if we give  $w$  ( $w$  is a finite family of set and every set in this family is non empty and different from the others, every  $A \in w, A \subseteq X$ ) and let  $\Omega_1 = w$ , then we give  $Q_1 = \{(\Delta C, B) | \Delta C \subseteq X, B \subseteq \Omega_1\}$ , then Let

$$\Omega_2 = \Omega(L(\Omega_1)) \setminus N_2 \cup |Q_1|$$

We give  $Q_2 = \{(\Delta C, B) | \Delta C \subseteq X, B \subseteq \Omega_2\}$ , then let

$$\Omega_3 = \Omega(L(\Omega_2)) \setminus N_3 \cup |Q_2|$$

The rest  $\Omega_i$  and  $Q_i$  can be given in the same manner.

And at some point for  $i \geq K$  ( $K \in \mathbb{N}^*$ ), we give  $Q_i = \{(\emptyset, B) | B \subseteq \Omega_i\}$  then  $\Omega_{K+1}, \Omega_{K+2} \dots$  can be decided, and at some point there exists a  $K$  such that  $\Omega_K = \{\Omega_1 \cup \bigcup_{j=1}^{K-1} |Q_j|\}$

### Remark 3.2

So we can see that if we give the  $w, K, Q_1, Q_2 \dots Q_{K-1}$ , then we can decide a union-closed family  $F$ .

### Remark 3.3

In fact, let  $K-1$  be 0, we see that the development of  $w$   $w = \{A_1, A_2 \dots A_n\}$  in the process of iteration  $\Omega(L(w))$  is not

depended on what specific element every  $A_i$  gets. It only depends on the truth-value in every independent area spilt up by  $w$ 's Venn Diagram. (If there exists an element in an area spilt up by its Venn Diagram, then the truth value is 1, else it's 0.).

### **3.The Fractal structure of poset and union-closed family**

In this part ,We start from studying the generalized structure of poset, which may result in a more specific conclusion on the structure of union-closed family.

#### **Definition 3.1**

Let  $X$  be a family of sets, we define that a widest incomparable subfamily  $W$  of  $X$  is the largest subfamily which satisfies that any sets  $x, y (x \neq y) \in W, x \not\subseteq y$  and  $y \not\subseteq x$ .

#### **Fact 3.1**

Let  $X$  be a family of sets, then there are two facts about its' widest incomparable subfamily  $W$ :

- (i)  $W$  may have many different choices
- (ii) Let  $W$  be one of those sets, for any other sets  $S$  in  $X-W$ , there exists a set  $S_0$  in  $W$  such that this  $s_0$  belong to  $S$  or  $S$  belong to  $S_0$ .

### Definition 3.2

Let  $X$  be a family of sets,  $W = \{a_1, a_2, a_3 \dots a_K\}$  is one of the widest incomparable subfamily of  $X$ . Then for every  $A \in X - W$ , there exists an  $a_i$  which can be compared with  $A$ . If  $A$  belongs to  $a_i$ , then for the other elements in  $W$ ,  $A$  belongs to  $a_j$  or  $A \not\subset a_j$  and  $a_j \not\subset A$ . We define that the set combined by all the sets in family  $X - W$  which satisfies this case is represented by  $W \downarrow$ . As for the other case, which means  $\forall a_i \in W \rightarrow A \not\subset a_i$  or  $a_i$  and  $A$  are incomparable. We define the set is represented by  $W \uparrow$  in this case.

### Lemma 3.1

Let  $w$  be a widest in comparable subfamily of  $X$ , then it's obvious that  $w \uparrow \cup w \downarrow = X - w$ ,  $w \uparrow \cap w \downarrow = \emptyset$ .

### Definition 3.3

- (i) Let  $w$  be a widest in comparable subfamily of  $X$ , if  $w \uparrow = \emptyset$ , we call this  $w$  is the top widest incomparable subfamily of  $X$ . Record it as  $X \uparrow$
- (ii) Let  $w$  be a widest in comparable subfamily of  $X$ , if  $w \downarrow = \emptyset$ , we call this  $w$  is the Low widest incomparable subfamily

of  $X$ . Record it as  $X\downarrow$ .

(iii) If  $w$  doesn't satisfies (i),(ii),we call this  $w$  is a medium widest incomparable subfamily of  $X$ . Record it as  $X\rightarrow$

### **Fact 3.2**

Let  $X$  be a family of sets, then there exists a subfamily  $W$  of  $X$  which is the top widest incomparable subfamily of  $X$  if and only if the amount of the maximal members in  $X$  is equal the amount of elements in its widest incomparable subfamily. Similarly, It is also true when it comes to the low widest incomparable subfamily.

### **Fact 3.3**

Let  $X$  be a family of sets, then  $X\uparrow$  and  $X\downarrow$  (if they do exist)are both unique.

### **Remark3.1**

However, when we talk about  $X\rightarrow$ ,it may exist several different  $X\rightarrow$ .

### **Definition 3.4**

Let  $X$  be a family of set, according to Fact3.2 and Fact 3.3,it can be classified into 4 cases:

- (i) It doesn't have a  $X \rightarrow$ , but it has the  $x \uparrow$  and  $x \downarrow$ .
- (ii) It doesn't have a  $X \rightarrow$ , it doesn't have the  $x \downarrow$ , but it has the  $x \uparrow$ .
- (iii) It doesn't have a  $X \rightarrow$ , it doesn't have the  $x \uparrow$ , but it has the  $x \downarrow$ .
- (IV) It has a  $X \rightarrow$ .

### **Remark 3.2**

In case (i), this  $x$  only has two widest incomparable subfamily.  
In case (ii) (iii), this  $x$  only has one widest incomparable subfamily.

### **Theorem 3.1**

$X$  is a family of sets, then it can be divided into several subfamily of  $X = X_1 \cup X_2 \cup X_3 \dots \cup X_k$  :

Which satisfies the following rules:

- (i)  $X_2, X_3 \dots X_{k-1}$  belong to case(i) mentioned in definition 3.4
- (ii)  $X_i \cap X_{i+1} = W_i (1 \leq i < k)$   $W_i$  is the low widest incomparable subfamily of  $X_{i+1}$ , and  $w_i$  is also the top widest incomparable subfamily of  $X_i$ .
- (iii)  $X_1$  belongs to case(i) or case(ii) while  $X_k$  belongs to or case (i) or case(iii).

### **Proof:**

We assume that  $X$  belongs to case(IV), then we can get a  $x \rightarrow$ , let  $x \rightarrow' = x \rightarrow \cup x \uparrow$ ,  $x \rightarrow'' = x \cup x \downarrow$ .

Then  $x \rightarrow'$  and  $x \rightarrow''$  take  $x \rightarrow$  as its top widest incomparable subfamily of  $X$ . and low widest incomparable subfamily of  $X$ .

We do this operation to  $Y$  who belongs to case(IV) in  $x \rightarrow'$  and  $x \rightarrow''$ , repeat this operation again and again, now that we assume this is a finite poset, so every time  $x \rightarrow'$  and  $x \rightarrow''$  have less elements than before, then there exists a time that all the sets separated from  $X$  are not in case(IV), let these sets be  $X_1, X_2 \dots X_n$ ,

Then we get  $X = X_1 \cup X_2 \dots \cup X_n$ .

### Fact 3.1

Let  $X = X_1 \cup x_2 \cup x_3 \dots \cup x_k$  ( $x, x_1, x_2 \dots x_k$  are defined in Theorem 3.1)  $M = |x_1 \cap x_2|$ , then  $|X_2| = |x_3| = |x_4| \dots = |x_{k-1}| = 2M$ ,  $|x_{k-1} \cap x_k| = M$ , in fact  $M$  is the width of this poset whose elements are sets.

### Definition 3.5

We call finite poset  $X$  is a square, if it can be divided into several subfamilies of  $X$ :

$$X = X_1 \cup x_2 \cup x_3 \dots \cup x_k$$

Which satisfies the following rules:

$$(1)|X_1|=|X_2|=\dots|x_k|=M$$

(2) $\forall i, i+1 (i > 0, i < k) X_i$  is the low widest incomparable subfamily of  $x_i \cup x_{i+1}$ , while  $x_{i+1}$  is the top widest incomparable subfamily of  $x_i \cup x_{i+1}$ .

### **Remark3.2**

From Theorem3.1, we can see that  $X$  is a square if and only if  $x_1$  belongs to case(i),  $x_k$  also belongs to case(i). And  $M$  is also the width of  $X$ .

### **Definition3.6**

We call  $X_1, X_2 \dots X_k$  the 1<sup>st</sup> line, the 2<sup>nd</sup> line...kth line of the square, kth floor is also defined as last floor.  $K$  is length of the square.

### **Corollary3.1**

$X$  can be decomposed into  $S_1 \cup S_2 \dots S_N$ ;  $S_1, S_2 \dots S_N$  are squares mentioned in definition3.5.

### **Proof:**

Let  $x$  be a finite family of sets, then let  $x = x_1 \cup x_2 \cup x_3 \dots \cup x_K$  ( $x_1, x_2 \dots x_K$  are defined in theorem3.1) if

$x_1$  or  $x_k$  does not belong to case(i), for example  $x_1$  belongs to case(ii) we let  $x_1' = x_1 - x_1 \cap x_2$ , and we let  $x_1' = B_1 \cup B_2 \cup B_3 \dots \cup B_{k-1} \cup B_k$  ( $B_1, B_2 \dots B_{k-1}, B_k$  are defined in theorem 3.1), at this time, the width of  $x_1'$  is shorter than the width of  $X$ , so  $B_i \cap B_{i+1} = M'$  ( $M' < M = |A_1 \cap A_2|$ ) The rest operation can be done in the same manner because of the finiteness of  $F$  and its width  $M$ . At the same time, we notice that when we decomposed  $x = x_1 \cup x_2 \cup x_3 \dots \cup x_k$  ( $x_1, x_2 \dots x_k$  are defined in theorem 3.1) Let  $S_1 = X \cap x_1 \cup x_2 \cup x_3 \dots \cup x_{k-1} \cup x_{k-1} \cap x_k$ , then  $S_1$  is a square. We let  $s_2 = B_2 \cap B_1 \cup B_2 \cup B_3 \dots \cup B_{k-1} \cup B_{k-1} \cap B_k$ , then  $S_2$  is a square. Now that  $|X|$  and  $M$  are both finite, so finally we prove that  $X$  can be decomposed into  $s_1 \cup s_2 \dots \cup s_N$   $S_1, s_2 \dots s_N$  are squares mentioned before

### Corollary 3.2

Let  $X$  be a finite poset, then  $x$  can be decomposed into  $S_1 \cup s_2 \dots \cup s_N$ , ( $s_1, s_2 \dots s_N$  are all squares) Then according to the operation which produces these squares, we can find these simple properties as follows:

(i) Every operation leads to a new square  $S_i$  built up. If this operation also leads to a new set  $x_1' = x_1 - x_1 \cap x_2$  which can be decomposed. Then the  $S_i$ 's built from  $X_1$  width is strictly less

than  $S_i$ 's width.

(ii) Let  $S_i$  be a square which is product by the decomposition of  $X$ ,  $d_{i1}, d_{i2} \dots d_{ik}$  is the 1<sup>st</sup> floor, 2<sup>nd</sup> floor ...kth floor of  $S_i$ . Then for any  $s > t$ ,  $\forall A \in d_s, \exists B \in d_t, B$  belongs to  $A$ ;  $\forall A \in d_t, \exists B \in d_s, B$  belongs to  $A$ .

### Definition 3.7

Let  $X$  be a poset and Let  $X = S_1 \cup S_2 \cup S_3 \dots \cup S_k$  ( $S_1, S_2 \dots S_k$  are defined in **Corollary 3.1**)

We define:

- (i) This decomposition is the Fractal decomposition of a poset
- (ii)  $l(S_i)$  = the length of  $S_i$
- (iii)  $S_{\text{first}} = \{d \mid \exists S_i (i \geq 2) \text{ such that } d \text{ is the first floor of } S_i\}$
- (iv)  $S_{\text{last}} = \{d \mid \exists S_i (i \geq 1) \text{ such that } d \text{ is the last floor of } S_i\}$

### Remark 3.3

Let  $X$  be a poset and Let  $X = S_1 \cup S_2 \cup S_3 \dots \cup S_k$ , if  $d_i$  is the last floor of  $S_i$ ,  $d_j$  is first floor of  $S_{i+1}$ . Then for  $\forall A \in d_j, \exists B \in d_i, A$  belongs to  $B$ , However, the statement  $\forall A \in d_i, \exists B \in d_j, B$  belongs to  $A$ ." is not True.

### Definition 3.8

Let  $X$  be a poset and Let  $X = S_1 \cup S_2 \cup S_3 \dots \cup S_k$  ( $S_1, S_2 \dots S_k$  are defined in Corollary 3.2).

For  $j > 1$ , we define  $P_1 = \{A \mid A \in \text{the Last floor of } S_1 \text{ and for any } x \text{ belongs to the first floor of } S_2, A \text{ doesn't belongs to } x\}$

$F_j = \{A \mid A \in \text{the first floor of } S_j \text{ and for any } x \in \text{the last floor of } S_{j-1} \text{ } x \text{ doesn't belong to } A\}$

$L_j = \{A \mid A \in \text{the Last floor of } S_j \text{ and for any } x \text{ belongs to the first floor of } S_{j+1}, A \text{ doesn't belongs to } x\}$

We define the strange set  $V$  of  $X = (\bigcup_{j=2}^k L_j \cup F_j) \cup P_1$

### Definition 3.9

When we say that two decomposition on the poset  $X$  are equal, we mean that the family of sets which is composed by the separated sets from each decomposition are same.

Now we come to discussion The relationship between those three decomposition mentioned part two and part three

### Theorem 3.2

Let  $X$  be a poset, then its minimal element decomposition is equal to its Fractal decomposition, and its minimal element decomposition is also equal to its Maximal element

decomposition **if and only if**  $V = \emptyset$ .

**Proof:**

Let  $V = \emptyset$ . Then the first floor of  $S_1$  is  $\Omega_1$  the second floor of  $\Omega_1$  is  $S_2$ , the rest can be checked by the definition of  $\Omega$ .

Let those decomposition are equal, then for any element  $A$  in the last floor of  $S_i (i > 1)$ , Because this is also a minimal element composition, there exists an  $B$  which belongs to the last floor of  $S_{i-1}$  such that  $B$  belongs to  $A$ , So  $F_j = \emptyset$ . On the other hand, this is also a maximal element decomposition so  $L_j$  and  $P_1 = \emptyset$ . So we get  $V = \emptyset$ .

### **Remark 3.4**

If  $F$  is a union-closed family, then it also must be a poset which has these three decompositions. Some useful decompositions may be used to help us to understand the structure of union-closed family like minimal element decomposition.

Remark: It's easy to see that if  $F$  is a union-closed family then the top of its decomposition must be  $\cup F$ .

It's also easy to see that if the union-closed families satisfies conjecture 1.1 if and only if it's True for all the union-closed family whose every floor  $d$  or  $\Omega$ , or  $\Phi$  has

more than one set.

#### 4.the topological sort of the union-closed family

In this part, we discuss about the topological sort on finite-union closed family  $F$ , which leads to several results on subfamilies of the union-closed family. In order to state our results, we need to introduce some definition.

##### Definition4.1

(i)Let  $F$  be a union-closed family,| Let  $G(V,E)$  be a directed graph,  $|F|=N=|V|$  ,  $F=\{A_1,A_2\dots,A_N\},V=\{a_1,a_2\dots,a_N\}$ ,Let function  $Q:F\rightarrow V: A_i\rightarrow a_i$ .Then  $Q$  is a Bijection.

And we define  $E$  as follow:

if  $A_i, A_j \in F, A_i \cup A_j = A_k (i \neq j, k \neq i, k \neq j)$  ,then edge  $\overrightarrow{a_i a_k}$  and edge  $\overrightarrow{a_j a_k} \in E$ ,if  $A_i, A_j \in F, (i \neq j)$  ,then edge  $\overrightarrow{a_i a_j} \in E$ .We mark this  $G(V,E)$  decided by  $F$  by  $G(F)$ .

(ii)We also define that two finite union-closed family  $F_1, F_2$  are equal if and only if  $|F_1|=|F_2|$ ,and there exists a function between  $F_1$  and  $F_2$  which is a bijection and injection such that it keeps the union operation.

(iii)For a directed graph  $G(V,E), V=\{a_1,a_2\dots,a_n\}$ ,when we

write  $a_{i1}a_{i2}a_{i3}\dots a_{ik}$  ( $i_1, i_2, \dots, i_k$  belong to  $\{1, 2, \dots, n\}$ ), it means  $\forall 1 \leq u \leq k-1, \overrightarrow{a_{iu}a_{iu+1}}$  belongs to E.

#### Fact 4.1

If  $A_i \cup A_j = A_k$ , then  $A_i$  belong to  $A_k$ ,  $A_j$  belong to  $A_k$ , so  $\overrightarrow{Q(A_i)Q(A_k)}$  and  $\overrightarrow{Q(A_j)Q(A_k)}$  belong to E.  
 If  $A_i \cup A_j = A_j$  or  $A_i$  then  $\overrightarrow{Q(A_i)Q(A_j)}$  belong to E.

#### Remark 4.1

We notice that for two union-closed family  $F_1$  and  $F_2$   $G(F_1)=G(F_2)$ , it doesn't mean that  $F_1=F_2$ , because if  $A_i \cup A_j = A_k$  ( $(i-k)(i-j)(j-k) \neq 0$ ) then we only describe  $A_i, A_j$  belong to  $A_k$  in  $G(F)$ , however, it does not mean that we describe  $A_k$  is just right the union of  $A_i$  and  $A_j$  in  $G(F)$

#### Lemma 4.1

$G(F)$  is an acyclic directed digraph.

#### Proof :

if has a cycle  $a_{i1}a_{i2}a_{i3}a_{i4}\dots a_{iu}$  ( $a_{iu}=a_{i1}$ ) then  $A_{i1}$  belong to  $A_{i2}, A_{i2}$  belong to  $A_{i3} \dots A_{iu-1}$  belong to  $A_{iu}=A_1$ , then  $A_{i1}=A_{i2}=A_{i3}\dots=A_{iu}$ , it is conflict with  $F$  is a none-repetitive set.

**Lemma 4.2**

We can give an order in union-closed family  $F$ , Let it be  $A_1, A_2 \dots A_N$ . For  $1 \leq i < j \leq N$  Let  $A_i \cup A_j = A_k$ , then  $k \geq \max\{i, j\}$

**Proof:**

$G(F)$  is an acyclic digraph, then it has a topological order, considering the Initialization from  $F$  to  $G(F)$ . Let the topological order in  $G(F)$  be  $i_1 < i_2 < i_3 \dots < i_N$ , then we order the sets in  $F$  as  $A_{i_1}, A_{i_2} \dots A_{i_N}$ , remark the  $A_{i_k}$  belong to  $\{A_{i_1}, A_{i_2} \dots A_{i_N}\}$  as  $A_k$ , then the new order  $A_1, A_2 \dots A_N$  is the topological order in  $G(F)$ .

**Definition 4.2**

Let  $G(V, E)$  be a Graph,  $|V|=N, V=\{a_1, a_2, a_3 \dots a_N\}$ . Let  $W=\{(a_i, a_i) | i=1, 2, 3 \dots N\}$ ,  $R=V \times V \setminus W$ , if there exists a  $S$  belong to  $R$  and there exists a function  $f$  between  $S$  to  $\{a_1, a_2, a_3 \dots a_N\}$ , we call this function  $f$  is the extra relation on  $G(V, E)$

**Definition 4.3**

Let  $F$  be a union-closed family,  $G(F)$  be the directed graph translated by  $F$ , we define an extra relation  $f$  on  $G(F)$  as follow:

Let  $S = \{(a_i, a_j) \in W \mid A_i \cup A_j = A_k, ((i - j)(i - k)(k - j) \neq 0)\}$

And function  $f : (a_i, a_j) \in S \rightarrow a_k$ . We use  $f[G(F)]$  to represent this extra relation on  $G(F)$ .

### Lemma 4.3

Let  $F$  be a union-closed family, we define  $F\{N\} = \{F \mid |F| = N\}$ .

We define:

$f\{N\} = \{f \mid \exists F \in F\{N\} \text{ such that } f \text{ is the extra relation on } G(F)\}$

We also define:

$(F, f)\{N\} = \{(G(F), f) \mid F \in F\{N\}, f \text{ is the extra relation on } G(F)\}$

Then function  $\varphi$  defined as follow:

$$\begin{aligned} \varphi: F\{N\} &\rightarrow (F, f)\{N\} \\ F &\rightarrow (G(F), f[G(F)]) \end{aligned}$$

Then  $\varphi$  is a bijection.

### Proof:

$F_1 \neq F_2$  if and only if there exist a pair of  $A_i, A_j (i \neq j) A_i \cup A_j = A_l (l \geq \{i, j\} \max)$  such that  $A_i \cup A_j = A_k (k \geq \{i, j\})$  but  $k \neq l$ .

### Case 1

$l = j, k \neq i, j$ , then  $(i, j)$  belongs to the original image set of  $f[G\{F_2\}]$  while  $(i, j)$  doesn't belong to the original image set of

$f[G\{F_1\}]$ , so  $\varphi(F_1) \neq \varphi(F_2)$

## Case2

$l > \{i, j\}_{\max}$ ,  $k > \{i, j\}_{\max}$ , then  $f[G(F_1)](i, j) = 1$  while  $f[G(F_2)](i, j) = k$

In summary,  $\varphi$  is a bijection.

## Corollary4.1

If  $F$  is a union-closed family, for  $\forall k (k > 0 \text{ and } k < |F| + 1)$ , it has a subfamily  $F$  such that  $|F| = k$

### Proof:

According to Lemma2.2 and Lemma2.3, for any  $F = \{A_1, A_2 \dots A_N\}$ , let  $V(G(F)) = \{a_1, a_2 \dots a_N\}$ ,  $a_1 a_2 \dots a_N$  is a topological sort for  $G(F)$ . For  $\forall k > 0$  and  $k < |F| + 1$ , we built  $\text{sub}F = \{Q^{-1}(a_j) \mid j = N, N-1 \dots N-k+1\}$ . Then according to the definition of  $G(F)$  and  $a_1 a_2 \dots a_N$  is a topological sort for  $G(F)$ ,  $\text{sub}F$  is a subfamily of  $F$  such that  $|\text{sub}F| = k$

## Definition 4.4

Let  $G(V, E)$  be a directed Graph with a extra relation on  $F$ , it is built as follow:

(i)  $|V| = N, V = \{a_1, a_2 \dots a_N\}$

(ii)  $E = \{e \mid \text{for } \forall 1 \leq i < j \leq N, \text{ we add } \overrightarrow{a_i a_j}, \text{ otherwise, we choose } k \text{ } (k > i, k > j) \text{ randomly and add } \overrightarrow{a_i a_k} \text{ and } \overrightarrow{a_j a_k}\}$

(iii) the extra relation  $f$  defined as:

$$S = \{(a_i, a_j) \mid \text{edge } \overrightarrow{a_i a_j} \text{ doesn't belong to } E\}$$

then we must choose the  $k$  for  $a_i, a_j$  defined in (ii)

$$f: S \rightarrow \{a_1, a_2, a_3 \dots a_n\}$$

$$(a_i, a_j) \rightarrow a_k$$

We call the graph  $G$  and the extra relation  $f$  on this graph an union-closed graph  $(G, f)$ .

#### Fact 4.2

The edges  $\overrightarrow{a_1 a_n}, \overrightarrow{a_2 a_n}, \overrightarrow{a_3 a_n} \dots \overrightarrow{a_{n-1} a_n}$  belongs to  $E$

#### Remark 4.2

If edge  $\overrightarrow{a_i a_j}$  belongs to  $E$  then  $(a_i, a_j)$  doesn't belong to  $S$ , if  $\overrightarrow{a_i a_j}$  doesn't belong to  $E$  then  $\exists k > i, k > j$  such that  $(a_i, a_j)$  belongs to  $S$  and  $f((a_i, a_j)) = a_k$

#### Lemma 4.4

Let  $S_1 = \{F \mid F \text{ is a union-closed family}\}$ , Let  $S_2 = \{(G, f) \mid (G, f) \text{ is a union-closed graph}\}$

Then function  $\omega$  :

$F \in S1 \rightarrow (G(F), f(G(F)))$  is an injection from  $S1$  to  $S2$ .

**Proof:**

(1) Compare definition 2.2 and definition 2.1 for  $\forall F$   $F$  is a union -closed family,  $(G(F), f(G(F))) \in S2$  so  $\omega$  is a function from  $S1$  to  $S2$ .

(2) From Lemma 2.3 we find that if  $|F1|=|F2|$  but  $F1 \neq F2$ , then  $(G(F1), f(G(F1))) \neq (G(F2), f(G(F2)))$  if  $|F1| \neq |F2|$ , then it's obviously that  $(G(F1), f(G(F1))) \neq (G(F2), f(G(F2)))$ . so  $\omega$  is an injection.

**Remark4.3**

$\omega$  is not a bijection, for example, let  $G=(V,E)$  be a union-closed graph, Let  $V=\{a1,a2,a3,a4\}$ , and we let  $a1a2$  belong to  $E$ ,  $a2a3$  belong to  $E$ ,  $f((a1,a3))=a4$ , if  $\omega(F) = V$  ( $F$  is an union-closed family) then  $A1$  belongs to  $A2$ ,  $A2$  belongs to  $A3$ ,  $A1 \cup A3 = A4 = A3$ , it's conflicted with the definition of  $F$ .

**Lemma4.5**

if  $G(V,E)$  is a union-closed graph and there exists a  $F$  such that  $\omega(F) = G$ , it's easy to see that this system must satisfy the

following rules:

- (i) if  $\overrightarrow{a_i a_j}$  belongs to  $E$ ,  $\overrightarrow{a_j a_k}$  belongs to  $E$ , then  $a_i a_k$  belongs to  $E$ .
- (ii) If  $(a_i, a_j)$  belongs to  $S$ , let  $a_s = f((a_i, a_j))$ ,  $\overrightarrow{a_j a_k}$  ( $k < N$ ) belongs to  $E$ , then  $(a_i, a_k)$  belongs to  $S$  and  $f((a_i, a_k)) = a_t$  ( $t \geq s$ ).

Now we give a conjecture based on directed acyclic graph which can reason out conjecture 1.1

#### Definition 4.5

- (i) Let  $(G(V, E), f)$  be an union-closed graph,  $V = \{a_1, a_2, \dots, a_N\}$ . For  $a_i \in V$ : we define  $W_i = \{a_j \mid \exists a_{k_0} a_{k_1} a_{k_2} a_{k_3} \dots a_{k_t} \text{ such that } a_{k_0} = a_i, a_{k_t} = a_N, \overrightarrow{a_{k_p} a_{k_{p+1}}} \in E, a_i \in \{a_{k_0}, a_{k_1}, \dots, a_{k_t}\}\}$
- (ii) Let  $G(V, E)$  be a graph, then we  $(a_i, a_j)$  and  $(a_i', a_j')$  are separated ( $a_i, a_j, a_i', a_j'$  belong to  $V$ ) if and only if  $\{a_i, a_j\} \cap \{a_i', a_j'\} = \emptyset$

#### Definition 4.6

Let  $(G(V, E), f)$  be an union-closed graph,  $V = \{a_1, a_2, \dots, a_N\}$  For  $a_i \in V$ , we define  $K_i = \{(a_i, a_j) \mid (a_i, a_j) \in S, \text{ and } f((a_i, a_j)) \in W_i, \forall a, b \in K_i, a, b \text{ are separated}\}$  We call this  $K_i$  a special set on

$a_i$ .

#### **Definition 4.7**

Let  $(G(V,E),f)$  be a union-closed graph,  $V=\{a_1,a_2,\dots,a_N\}$ ,  $P_i=\{K_i|K_i \text{ is a special set on } a_i\}$ , we defined  $[P_i]=\{|K_i|\}_{\max}$

#### **Conjecture 4.1**

Let  $(G(V,E),f)$  be a union-closed graph,  $V=\{a_1,a_2,\dots,a_N\}$ , then  
$$\{[P_i]+|W_i|\}_{\max}^{1 \leq i \leq N} \geq \frac{N}{2}$$

#### **Remark 4.4**

If Conjecture 4.1 is True, then the Conjecture 1.1 is True.

### **5. some results on Frankl's conjecture based on the minimal decomposition of union-closed family**

#### **Lemma 5.1**

Let  $X=\bigcup_{i=1}^k \Omega_i$ , if  $A$  belongs to  $\Omega_i$  ( $i \geq 1$ ) is an old generated element, let  $B=\{A|A \text{ belongs to } \Omega_i \text{ and } A \text{ also belongs to } B\}$ . Then each pair of  $C,D$  ( $C \neq D$ ) belong to  $B$ ,  $C \cup D = B$ .

#### **Proof:**

Now that  $C \cup D$  belongs to  $B$ , if  $C \cup D \neq B$ , then  $B$  must belong

to  $\Omega_k (k \geq i + 1)$ , it's conflicted with B belong to  $\Omega_i$ .

### Definition 5.1

If B is a union-closed family without any new- addition element, then we call B is a normal union-closed family.

### Lemma 5.2

Let F be a union-closed family  $F, F = \bigcup_{i=1}^K \Omega_i$  .if  $K \leq 2$ , then for this case the conjecture is True.

#### Proof:

For  $K=1$  : then  $|\Omega_1|=1=|F|$ , it's true for this case.

For  $K=2$  : Let  $\Omega_1 = \{A_1, A_2 \dots A_n\}$   $\Omega_2 = \{A\} |A|=m$

Then:

$$\begin{aligned} \sum_{1 \leq i < j \leq n} |A_i| + |A_j| &\geq \sum_{1 \leq i < j \leq n} |A_i \cup A_j| \\ &\geq \sum_{1 \leq i < j \leq n} |A| \\ &= \frac{n(n-1)}{2} |A| \\ \sum_{1 \leq i < j \leq n} |A_i| + |A_j| &= (n-1) \sum_{i=1}^n |A_i| \geq \frac{n(n-1)}{2} |A| \\ \rightarrow |A| + \sum_{i=1}^n |A_i| &\geq \frac{n+2}{2} |A| \\ \rightarrow \exists x \in &\text{at least } \frac{n+2}{2} \text{ sets in this family.} \end{aligned}$$

### Definition 5.2

Let F be a finite family of sets  $F = \{A_1, A_2 \dots A_n\}$  (in this family  $A_i, A_j$  with different mark can be one same set)

We define that  $\|F\| = \sum_{i=1}^n |A_i|$

## Lemma 5.2

Let  $X = \bigcup_{i=1}^n \Omega_i$ , if  $A_1$  belongs to  $\Omega_i (i > 1)$  is an old generated element, let  $B_1 = \{A | A \text{ belongs to } \Omega_i \text{ and } A \text{ also belongs to } A_1\}$ . Let  $A_2 (A_2 \neq A_1)$  belongs to  $\Omega_i (i > 1)$  be an old generated element, let  $B_2 = \{A | A \text{ belongs to } \Omega_i \text{ and } A \text{ also belongs to } A_2\}$ .

Then  $|B_1 \cap B_2| \leq 1$

### Proof:

If  $|B_1 \cap B_2| > 1$ , then we can two different sets  $C_1, C_2$  selected from  $B_1 \cap B_2$ , such that  $A_1 = C_1 \cup C_2 = A_2$ , but  $A_1 \neq A_2$ .

## Theorem 5.1

If  $B$  is a normal union-closed family,  $F = \bigcup_{i=1}^k \Omega_i$ , Let  $|\Omega_1| = n_1, |\Omega_2| = n_2, |\Omega_3| = n_3, \dots, |\Omega_{k-1}| = n_{k-1} = p, |\Omega_k| = 1$ , then there exists an element  $x \in F$  belongs to at least  $1 + \frac{p}{2} + \frac{1}{p-1} * c(n_1, n_2, \dots, n_{k-2}, k)$  sets in this family.  $c$  is a constant which is decided by  $n_1, n_2, \dots, n_{k-2}, k$ :

$$c = 1 + \sum_{j=1}^{k-3} 2^j \prod_{i=k-1-j}^{k-2} \frac{1}{n_i(n_i-1)}$$

### Proof:

For A which belongs to  $\Omega_i (i > 2)$ , Let  $W_A = \{B \mid B \text{ belongs to } \Omega_i - 1 \text{ and } B \text{ belongs to } A\}$

Let  $\Omega_2 = \{A_1, A_2 \dots A_{n_2}\}$

Let  $\|\Omega_k\| = m = \|UF\|$

Let  $|w_{A_1}| = k_1, |w_{A_2}| = k_2 \dots |w_{A_{n_2}}| = k_{n_2}$

Then according to Theorem 4.1 and Lemma 4.1 :

$$\|L(w_{A_1})\| \geq \frac{k_1(k_1-1)}{2} |A_1|$$

$$\|L(w_{A_2})\| \geq \frac{k_2(k_2-1)}{2} |A_2|$$

...

$$\|L(w_{A_{n_2}})\| \geq \frac{k_{n_2}(k_{n_2}-1)}{2} |A_{n_2}|$$

Notice that:

$$\|L(w_{A_1})\| = (k_1-1) \|w(A_1)\|$$

$$\|L(w_{A_2})\| = (k_2-1) \|w(A_2)\|$$

...

$$\|L(w_{A_{n_2}})\| = (k_{n_2}-1) \|w(A_{n_2})\|$$

So we get:

$$\|w(A_i)\| \geq \frac{k_i}{2} \|A_i\| \quad (1 \leq i \leq n_2)$$

$$\sum_{i=1}^{n_2} \|w(A_i)\| \geq \sum_{i=1}^{n_2} \frac{k_i}{2} \|A_i\|$$

( $k_i \geq 2$ )

On the other hand, according to lemma 5.2 we notice that:

$$\frac{n_2(n_2-1)}{2} \|\Omega_1\| \geq \sum_{i=1}^{n_2} \|w(A_i)\| \geq \sum_{i=1}^{n_2} \frac{k_i}{2} \|A_i\|$$

On account of  $k_i > 1$  So:

$$\|\Omega_1\| \geq \frac{2}{n_2(n_2-1)} \sum_{i=1}^{n_2} \|A_i\| = \frac{2}{n_2(n_2-1)} \|\Omega_2\|$$

The rest may be deduced by analogy:

$$\|\Omega_1\| \geq 2^{k-2} \prod_{i=2}^{k-1} \frac{1}{n_i(n_i-1)} \quad \|\Omega_{k-1}\| \geq 2^{k-3} m * p *$$

$$\prod_{i=1}^{k-1} \frac{1}{n_i(n_i-1)}$$

....

$$\|\Omega_{k-2}\| \geq 2^0 m * p * \frac{1}{n_{k-1}(n_{k-1}-1)}$$

$$\|\Omega_{k-1}\| \geq 2^{-1} * m * p$$

So we get:

$$\begin{aligned} \sum_{A \in F} \frac{|A|}{m} &= \sum_{i=1}^k \|\Omega_i\| * \frac{1}{m} \geq \\ 1 + p * (2^{-1} + 2^0 \frac{1}{p(p-1)} + 2 \frac{1}{n_{k-2}p(p-1)(n_{k-2}-1)} + \dots + 2^{k-3} \prod_{i=2}^{k-1} \frac{1}{n_i(n_i-1)}) \\ &= 1 + \frac{p}{2} + \frac{1}{p-1} (1 + \sum_{j=1}^{k-3} 2^j \prod_{i=k-1-j}^{k-2} \frac{1}{n_i(n_i-1)}) \\ &= 1 + \frac{p}{2} + \frac{1}{p-1} * C \end{aligned}$$

### Remark 5.1

This estimation is not the strongest one, however, we think it may provide us a possible way to estimate that average according to the structure of an union-closed family given in theorem 3.1.

### Acknowledgement

I thank my tutors Cunwei Song and xiaohua Zhou for help

and assistance in writing this article. And I also thank the editor who comments on this paper for his/her valuable advice.
